

I fully support the proposal to regulate by bandwidth rather than emission type. This proposal will allow for additional experimentation and growth of amateur radio.

Much concern has been expressed that certain modes would take over all of the available spectrum, but there has been no evidence presented that this would be the case. Amateur radio operators have had a long history of self regulation and adherence to voluntary band plans. This self regulation will continue and those modes that are not compatible will segregate themselves regardless of bandwidth.

I recommend the FCC adopt this proposal in its entirety.
